TITLE: Considerations on Static Friction Forces During Rolling of Cylindrical Bodies (Perekatyvaniye tsilindrcheskikh tel pri uchete sily treniya stsepleniya)

PERIODICAL: Tr. Dnepropetr. in-ta inzh. zh. -d. transp., 1958, Nr 26,
pp 322-335

ABSTRACT: The author examines the two-dimensional problem of the rolling of an elastic cylindrical body over an elastic surface. As in the case of the paper of N. I. Glagolev (Prikl. matem. i mekhan., 1945, Nr 9), it is assumed that the line of contact is composed of one static segment and two segments of sliding. However, in contrast to the work indicated, this author suggests that the coefficient of sliding friction be assigned a value equal to one-half of the coefficient of static friction, and presents an experimental curve which confirms the correctness of this ratio. In deriving computational relationships, the author utilizes the results obtained by N. I. Muskhelishvili [Nekotoryye osnovnyye zadachi matematicheskoy

Considerations on Static Friction Forces During Rolling (cont.)

teorii uprugosti (Some Fundamental Problems of the Mathematical Theory of Elasticity). Izd-vo AN SSSR, 1954). In investigating the expressions for the traction force, the author points out that they differ considerably from analogous expressions known heretofore and shows that any locomotive will develop maximum traction when the ratio of the length of the static segment to the line of contact is ~0.3. Experimental evidence is presented which demonstrates that both the area of contact and the magnitude of the minor axis of the ellipse are functions of the pressure exerted by a wheel on the rail. A table of coefficients employed in the computations is given.

TITLE: The Rolling of Elastic Bodies with Constant and Variable Friction Coefficient under Conditions of the Three-Dimensional Problem of Elasticity Theory

PERIODICAL: Izvestiya Akademii nauk SSSR, Otdeleniye tekhnicheskikh nauk, Mekhanika i mashinostroyeniye, 1960, Nr 3,
pp 170-174 (USSR)

ABSTRACT: The diagram representing the rolling of a locomotive wheel on the rails, and the coordinate system, is shown in Fig 1. It is assumed that the wheel and rails have an initial tangent at a point which is taken as the origin of coordinates. The wheel moves in the direction of the force T_2 . All quantities relating to the rails and wheel have indices 1 and 2 respectively. The contact plane σ is resolved into a slip plane σ_1 and an adhesion plane σ_2 (Fig 2). In the plane $z = 0$ the stresses are subject to the conditions (1.1) outside σ and (1.2) in σ . If the friction coefficient is constant, the analysis of section 2 leads to the expression (2.22) where γ is the Coulomb coefficient

News in Brief

PERIODICAL:

Zavodskaya laboratoriya, 1959, Vol 25, Nr 8, pp 1016-1018
(USSR)

ABSTRACT:

1) The author reports on a machine he designed for testing the friction coefficient of sliding (FCS). The machine (Fig) has an electromotor which rotates wheels of various sizes (diameter 100-800 mm) on a rail. The rail is pressed with a hydraulic press toward the wheel and is connected to a dynamometer. To investigate the (FCS) the author used an oscillograph MVO-2. 2) The author reports on a device for testing the adhesiveness of galvanic coatings by the method of tare blows. The device (Fig) is a plate with hemispherical hollows (30, 24, 22, 20, 18, 16, and 14 mm diameter (D)) on which a weight (1 kg) having a percussion pin on its end ($D = 16$ mm with a hemisphere having a D of 5 mm in the center) is dropped from varying heights. The sample is put on this plate. According to

Card 1/3

News in Brief

SOV/32-25-8-42/44

the height of falling of the weight and the greater the hollow beneath it, the greater is the load and therefore the deformation of the coating. 3) The author recommends the use of a "viniplast" thermostat flask for processing 6 roentgenograms, which has a capacity of 250 ml (Fig). 4) The author recommends the use of a gear pump with water lubrication, for laboratories when small quantities of a liquid have to be pumped (Fig). The two gears of the pump rotate in rubber bearings. The driving wheel is driven by a motor type MUN-100/80 (220 v, 100 w, 2200 rpm). Dimensions of the pump are 65 × 110 × 50 mm, diameter of the gears is 37 mm, capacity approximately 20 l/min. 5) The authors developed a universal device for the determination of greater stresses. The device is a separator with several balls with a diameter of 20-24 mm and a series of steel lamina (steel 3) with a thickness of 15-25 mm. One of the steel lamina serves as a standard on which the balls having the desired diameter are impressed with a pressure of 5, 10, 15, 20, 25, 30, 35, and 40 t. The device is installed at the spot where stress is being measured. Each ball makes an impression on the lamina under the given stress and the diameter of the impression is measured. The strength trans-

Card 2/3

1957, No.5, pp.126-129 (U.S.S.R.)

ABSTRACT: The problem of rolling of a wheel along an elastic semi-plane has been considered by Glagolev, N.I.(1) and Fromm (2). The assumption was derived that friction between the contacting surfaces obeys the Coulomb law and that the friction coefficient does not depend on the speed. These authors solved the problem for the case that the elastic constants of both bodies are the same. It was established that the contact surfaces can be sub-divided into two parts, namely, a coupling surface without slip and a slipping surface. In this paper an attempt is made to evaluate the influence of the speed on the change in the adhesion coefficient assuming a linear dependence of the friction coefficient on the relative speed of the points of the contacting surface and also that the elastic constants of

Card 1/2

Dependence of the adhesion coefficient on the speed of
rolling. (Cont.) 24-5-19/25

the two contacting bodies are equal. Utilisation of the derived formulae is illustrated by the calculation of the movement of an electric locomotive along a rail, assuming that the driven wheel, of 60 cm radius, carries a load of 11 tons. The calculated maximum traction force as a function of the speed is graphed in Fig. 3; the results are correct only for rolling speeds at which the relative speed at the contact area does not exceed 5 cm/sec. There are 3 figures and 4 references, 2 of which are Slavic.

TITLE: Free carrier absorption in silicon in the 40—100 micron region

SOURCE: Optika i spektroskopiya, v. 18, no. 2, 1965, 318-320

TOPIC TAGS: silicon, absorption, free carrier absorption, infrared absorption, lattice absorption, free carrier

ABSTRACT: Measurements were made at room temperature of the transmission of n-type Si specimens with a free carrier concentration of $4 \cdot 10^{14} \text{ cm}^{-3}$ and a resistivity of 15 ohm·cm, and of compensated samples with a resistivity of $10^4 \text{ ohm} \cdot \text{cm}$ obtained by fast neutron bombardment. The experiments were conducted in the spectral range between 40 and 100 microns on samples 1—10 mm thick. Figure 1 of the Enclosure shows the variations of the coefficient of absorption (k) of Si samples with a resistivity of 15 ohm·cm. Curve 2 shows the spectral variation of the coefficient of absorption of free carriers (k_f) calculated from the Drude-Zener formula. Curve 3 shows the spectral variation of the coefficient of absorption (k_b) of Si specimens bombarded with fast neutrons (compensated samples). Curve 4 shows the spectral variation of the coefficient of absorption by free carriers calculated by the

Card 1/3

L 29512-65

0

formula $k_F = K + k_b$. Curve 5 shows the spectral variation of the coefficient of absorption of the crystal lattice calculated from the formula $k_F = k + k_b$ on the assumption that $k_F = k_1$ (k_1 being the coefficient of absorption at the long-wavelength wing of the absorption band at 16.4 micron which is associated with the lattice vibrations of samples activated with impurities and structural defects). The experimental data for free carrier absorption are in reasonable agreement with the absorption figure calculated with the Drude-Zener formula. Orig. alt. has: 2 formulas and 1 figure. [CS]

TITLE: Transmission of coated silicon in the long wave infrared region of the spectrum

SOURCE: Optika i spektroskopiya, v. 21, no. 4, 1966, 476-481

TOPIC TAGS: silicon, optic coating, ir spectrum, optic transmission

ABSTRACT: The authors have measured in the 20 -- 100 nm range the spectra of silicon coated with a layer of silicon dioxide to enhance its transmission. The transmission spectra were measured with a long-focus infrared spectrometer (DIKS-1), with an echelle grating of 6 lines/mm. The filters used to eliminate the extraneous radiation and to reduce the level of the scattered radiation to less than 5% are described. The spectral width of the slit was 1 -- 2 nm, and the accuracy with which the transmission was determined was 2 -- 3%. Samples of different coating thickness were measured. The results showed that the position of the transmission maximum (λ_{\max}) changed appreciably, from 42 to 90 nm, as the thickness of the coating was varied. The largest attainable transmission was 90%. The optical characteristics of the coating are tabulated, and ways of further improving the coating efficiency are

1054. BRONCHOSCOPY IN DIAGNOSIS OF CANCER OF THE LUNG (Russian text) - Rudyavskiy B. A. - KHIRURGIYA 1957, 12 (12-19) Tables 2
454 patients with cancer of the lung were admitted to the state P. A. Guertzen Oncological Institute during 1948-1953. Bronchoscopy was performed in 255 patients. Out of this number the right lung was affected in 142 cases and the left one in 113. The lesions were found in the upper lobe in 168 patients and in the lower lobe in 64. The results and analyses of bronchoscopy, biopsy and other investigations are presented. In well recognizable tumours pneumectomy could be performed only in 16 patients out of 70. Only 3 patients out of 48 forming the group with indirect signs were operated upon.

TITLE: Antifriction compositions based on filled polyamides

SOURCE: Plasticheskiye massy*, no. 4, 1964, 33-37

TOPIC TAGS: antifriction composition, polyamide, filled polyamide, graphite
filled polyamide, talc filled polyamide, physical property, mechani-
cal property, electrical property

ABSTRACT: The antifriction and other physical, mechanical and electric pro-
perties of filled polyamides were investigated, as well as their application in
structural work. The following polyamides were tested: (T=talc, G=graphite,
Mo=molybdenum disulfide, Ba=barium sulfate, numbers=% filler) Polyamide 68,
68-T20, 68-T40, 68-Mo5, 68-Ba5, Capron, K-T10, K-Mo1.5, K-Ba10, K-G10

Card 1/3

ACCESSION NR: AP4028550

surfaces, for instance in the construction of runners where the use of AK-7T20 (cemented to the metal with epoxy ED-5) reduces metal requirements and costs. The coefficients of friction for AK-7 and AK-7T20 are 19 and 61% less than for DSP-B at 500 kg /linear cm., and 6 and 20% less at 2000-2500 kg /running cm. A method was developed for preparing antifriction working surfaces on large metal articles comprising coating the cleaned and degreased metal with polyamide granules (low molecular polyamide with a small amount of epoxy resin as binder) and curing at room or elevated temperature. The work load of friction machines with polyamide surfaces may be further increased by the use of lubricants. Injection molded articles, even of complex configuration, may be made from filled polyamides. Orig. art. has: 6 figures and 2 tables.

Full Title: ANTIFRICTION QUALITIES AND THE RESISTANCE TO WEAR OF
WOOD-LAMINATED PLASTICS (WLP) INADEQUATELY LUBRICATED
WITH WATER

Transliterated Title: Antifriktsionnyye svoystva i iznosostoykost'
drevesnosloistykh plastikov (DSP) pri nesovershennoy
smazke vodoy

PUBLISHING DATA

Originating Agency: Academy of Sciences, USSR. Machine-Building
Institute, Treniye i iznos v mashinakh (Friction and Wear in
Machines), Issue VIII

Publishing House: Academy of Sciences, USSR

Date: 1953 No. pp.: 26 (60-86) No. of copies: 2,500

Editorial Staff

Editor: Khushchov, M. M., Prof.

PURPOSE: Technical improvements and the development of wear-resistant
machine parts.

TEXT DATA

Coverage: Under the supervision of the author a series of tests was
made in order to determine the antifriction and wear resistance
properties of WLP. Several brands of WLP in combination with various
1/2

metals at various pressures and at three different speeds were tested.
Comparative tests were made with other non-metallic antifriction
materials such as ebonite, oak, etc. Several testing machines are
described, and specifications of testing specimens are given. Photos,
diagrams, graphs, tables.

APPROVED FOR RELEASE: 08/22/2000 CIA-RDP86-00513R001446010007-8"

A conventional method of testing antifriction and wear-resistance
properties of materials.

Transactions of the Conference (Cont.)

SOV/6206

75

COVERAGE: The book is a collection of articles delivered at the Conference on Plates and Shells held in Kazan' from 24 to 29 October 1960. The articles deal with the mathematical theory of plates and shells and its application to the solution, in both linear and nonlinear formulations, of problems of bending, static and dynamic stability, and vibration of regular and sandwich plates and shells of various shapes under various loadings in the elastic and plastic regions. Analysis is made of the behavior of plates and shells in fluids, and the effect of creep of the material is considered. A number of papers discuss problems associated with the development of effective mathematical methods for solving problems in the theory of shells. Some of the reports propose algorithms for the solution of problems with the aid of electronic computers. A total of one hundred reports and notes were presented and discussed during the conference. The reports are arranged alphabetically (Russian) by the author's name.

Rudykin, Grigoriy Alekseyevich

Tekhnika izmereniya razmerov v mashinostroyenii (Methods of Engineering Measurements in Machine Building) 3d ed., rev. Moscow, Mashgiz, 1958. 351 p. 8,000 copies printed.

Reviewers: Rymar', N.F., Engineer; Ed.: Shelkov, N.I., Engineer; Tech. Ed.: Uvarova, A.F.; Managing Ed. for Literature on Machine Building and Instrument Construction (Mashgiz): Pokrovskiy, N.V., Engineer.

PURPOSE: This book is intended for engineers and technical workers in plant and testing laboratories and also for departmental inspection agencies.

COVERAGE: The book deals with various methods of engineering measurements in machine building and with techniques of checking the most important industrial measuring devices. Principles of operation of modern measuring tools and instruments, their design features, accuracy, measuring capacities, and other technical characteristics

Card 1/ 8

Methods of Engineering (Cont.) 1041

are presented. The following types of instruments are discussed: mechanical, static, pneumatic and special, as well as automatic equipment and devices for inspecting various products in lot and mass production. No personalities are mentioned. There are no references.

RUDKEVICH, G. A.

Tekhnika i sredstva izmerenii v mashinostroenii (Technique of Dimensional Measurement in Machine Building), Second Edition, Mashgiz.

The book gives a brief history of the development of linear measurement, and mentions the merits and shortcomings of measurement, and errors in measurement. It states the problems concerning the classification of scored, and parallel-plane-tip linear measurements, norms for their accuracy, and methods of checking, and describes the most widely used measuring instruments and apparatus.

The book is intended for technical engineering personnel whose work brings them in contact with measuring instruments.

TITLE: Device for compensating amplifier input capacitance. Class 21, No. 170548

SOURCE: Byulleten' izobreteniy i tovarnykh znakov, no. 9, 1965, 33

TOPIC TAGS: amplifier input capacitance, adjustable amplification factor, micro-electrode

ABSTRACT: The proposed device for compensating the input capacitance of an amplifier during microelectrode experiments contains a differentiator amplifier which is connected in parallel to the main amplifier. In this compensating amplifier, gain is automatically adjusted by a key circuit. One input of the key circuit is connected to the output of the device and the other input, to the output of a reference pulse generator. The generator output is in turn connected to the object of the experiment (see Fig. 1 of the Enclosure). The output of the key circuit is connected through a storage device to a thermistor which regulates the gain of the compensating amplifier. Orig. art. has: 1 figure) [DW]
